RESEARCH RATIONALE

Content-area writing in middle school requires the ability to generate ideas and extract key points from the content. Students also need to recall essential information, especially for science and social science content-area writing. However, students with learning disabilities (LD) often lack these skills, which affects their academic success.

In recent years, society has become technology-dependent due to the advancement of digital technology in every step of human life. Researchers have invented assistive technologies that can be used in the classroom setting to assist students in having a practical learning experience.

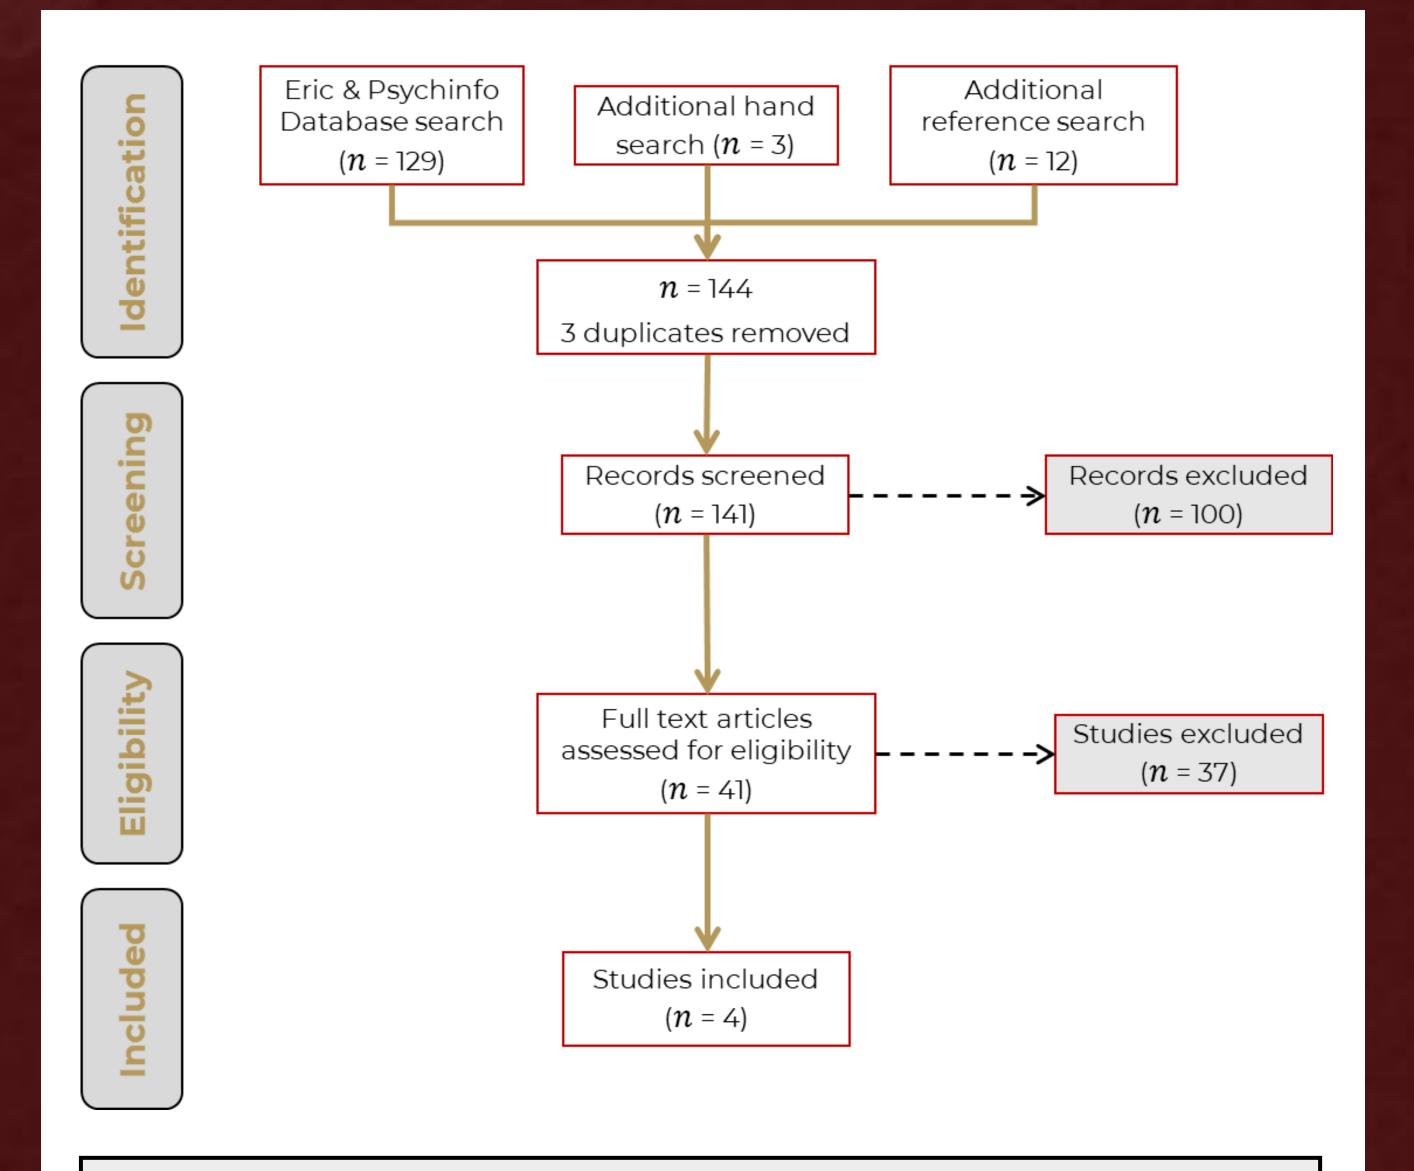

The purpose of this study was to

- * Review effective technology interventions for writing
- Explore how technology tools support middle school students in extracting essential points from classroom content
- Summarize improvement in independent writing skills of students with disabilities

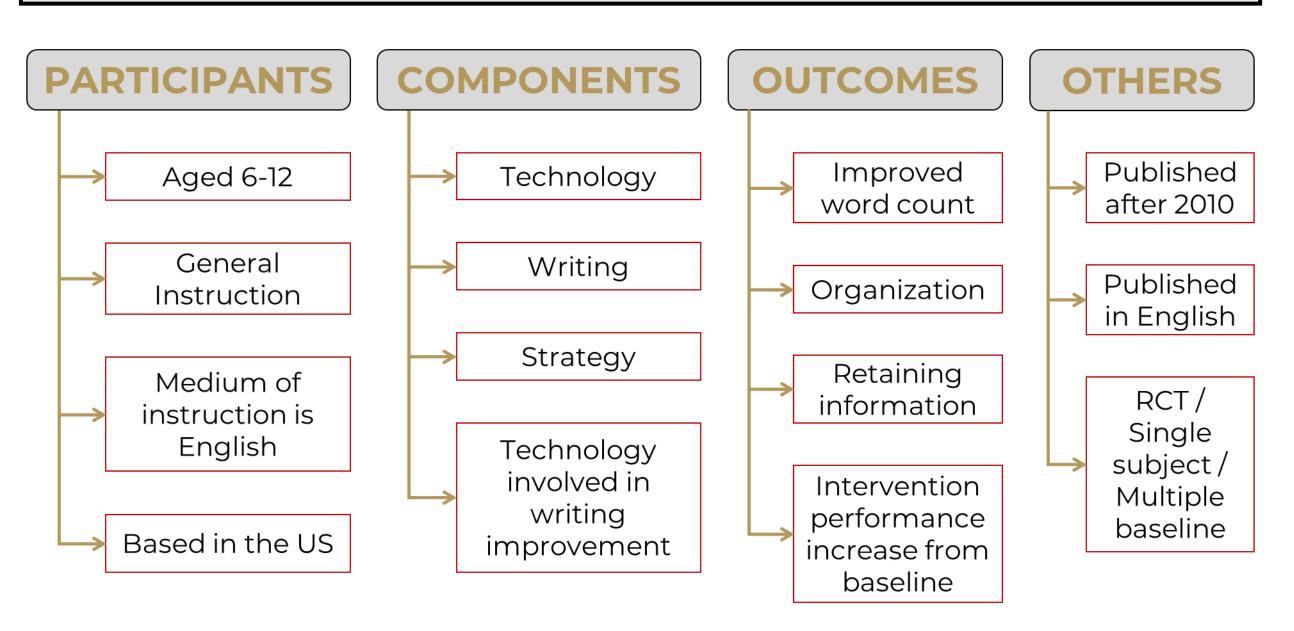

RESEARCH QUESTION

Which writing and note-taking assistive technologies and strategies are effective in improving content knowledge in middle school science and social studies for students with high incidence disabilities or learning disabilities?

METHODOLOGY

INCLUSION CRITERIA

VARIABLES

Independent Variables

Computer-Based Graphic Organizers (CBGOs), Technology-Based Graphic Organizers (TBGOs), writing strategies, and note-taking strategies in middle school

Dependent Variables

Number of words, number of sentences, number of transition words, accessible elements and holistic writings, supporting details with a statement containing facts, analytical support, syntactical maturity in composition, and overall organization

RESULTS

| | Boyle et al. (2016) | Evmenova et al. (2016) | Evmenova et al. (2020) | Unzueta & Barbetta (2012) |
|---------------------------|--|--|--|---|
| Study Design | Mixture of qualitative (interviews) and quantitative (pre- /post within-subjects) data | Multiple-baseline single case (3 groups) | Pre/post within- subjects | Single-subject multiple-baseline |
| Participants (<i>n</i>) | 36 | 10 | 43 | 4 |
| Setting | Suburban middle school | Low-performing suburban middle school | Low-performing middle school | Middle school with high Hispanic student population |
| Independent variable | Note-taking metacognitive strategy, video- lecture content | Computer-based graphic organizer (CBGO) | Text to speech in Microsoft TBGO | CBGO |
| Dependent variables | Retaining vocabulary words from lecture | Writing quality, number of words, number of sentences and transition words. | Writing quality, number of words, number of sentences and transition words. | Writing quality, planning, organizing |
| Findings | Increases in Cued Lecture Point (1.2 → 6.7), Total Lecture Point (3.5 → 11.5), and Vocabulary Instances (3.7 → 15.3) | Increases in number of words (80%), sentences (90%), transition words (100%), essay elements (100%), and holistic writing quality (100%) | Increases in number of words (43%), transition words (103%), and essay parts measure (76%) | Increases in number of words (138), organizing-planning time (7.5 min), and syntactical maturity (12.2 T Units) |

CONCLUSIONS

CONCLUSIONS

- Computer-based graphic organizers (CBGOs) can be helpful for students who struggle remembering content or organizing points while writing.
- There is very limited evidence on technology-based interventions for (a) improvement in writing, and (b) middle school students.

LIMITATIONS

- Short-term interventions and small sample sizes
- Students with emotional disturbances and other comorbidities were not included.
- Long-term effect of CBGOs is unknown.
